ABOUT TRUTH SECURITY

Truth Security Audits conducts a comprehensive security review of blockchain applications, using modern tools and employing only the most experienced solidity experts on the market. During the elaboration of the audit, auditors analyze possible attack vectors both from the project owners and its users and rate them by Severity (see Appendix A) from Informational to Critical as per common reason, giving an adequate explanation in the body of the audit. Our Audits are versioned, and clients get a grace period to alleviate or comment on all of our findings.

METHODOLOGY

As per standard code review practices, we use manual and static analysis. During the manual phase, auditor(s) review source code line-by-line, studying its intended and actual behavior, referencing known vulnerabilities (including SWC Registry <https://swcregistry.io/>), comparing the code to common contracts, and noting all things that are out of the ordinary for confirmation or rejection. Static analysis refers to a computer-aided analysis of the code, providing automatized and powerful insight into additional subtle issues possibly present in the code.

Some auditors additionally write their own test cases and try to break the contracts in their own local simulated blockchain environment. This is called dynamic analysis and is often employed in the more complex contracts, where consolidated testing scenarios help assess the completeness of contract logic or reversely give a proof-of-concept for potential security vulnerability.

Finally, all auditors do on-chain verification of live contracts. This crucial step confirms contracts were not swapped for malicious only after audit, or that parameters are set based on reasonable expectations. Issues such as non-renounced ownerships are also assessed in this step.

PROJECT DETAILS

Project Name	MagiK.Finance
Description	<p>The \$MAGIK'S algorithmic token serves as the backbone of a rapidly growing ecosystem aimed towards bringing liquidity and new use cases to the Opera network. The protocol's underlying mechanism dynamically adjusts \$MAGIK's supply, pushing its price up or down relative to the price of \$FTM. Magik Finance uses its three native tokens alongside manually and algorithmically adjusted contraction and expansion mechanisms to maintain a \$FTM peg.</p> <p>The three main tokens are:</p> <ul style="list-style-type: none">Magik (\$MAGIK).Magik Shares (\$MSHARE)Magik Bonds (\$MBOND).

SUMMARY

AUDIT PROCEDURE

Auditors	Robert Morgan III
Audited as	Truth Seekers
Methodology	<p>Static Analysis + Dynamic Analysis</p> <p>Static analysis examines code to identify issues within the logic and techniques. This type of analysis addresses weaknesses in source code that might lead to vulnerabilities. Static analysis supports development operations by creating an automated feedback loop. Static review can lead to false positives/negatives which Truth Seekers confirms or denies with penetration testing. Static analysis is being used on Magik.Finance because it specifically identifies defects before you run a program (e.g, between coding and unit testing)</p>
Tools	<p>Dynamic analysis finds vulnerabilities in a runtime environment. Automated tools analyze the input and output of an application for potential threats like SQL injection. Tools can also search for other application-specific issues and analyze server configuration errors. The purpose of dynamic analysis is to analyze the program as an attacker would, looking for entry points and vulnerable sections during program execution. Hence, we create a well written suite of manually ran unit and regression tests,</p>

Truth Security Audits has no control over website UI projects provide. Always double check you are signing a contract matching one of the contracts in section Objects of Review.

Truth Security Audits concerns itself exclusively with code quality and smart contract security. We have not audited tokenomics, nor a general likelihood of making money with this project. Truth Security report is not financial advice.

FINDINGS

Finding ID	MShareReward Pool	Severity	Major
Type	Re-entrancy Vulnerability	Status	Unresolved
Location	L: 765, 786, 806		
Description	<p>L: 765: function deposit(uint256 _pid, uint256 _amount) external nonReentrant {</p> <p>L: 786: function withdraw(uint256 _pid, uint256 _amount) external nonReentrant {</p> <p>L: 806: function emergencyWithdraw(uint256 _pid) external nonReentrant {</p> <p>This nonReentrant() modifier Prevents a contract from calling itself, directly or indirectly. Calling a nonReentrant function from another nonReentrant function is not supported. This protects against reentrancy hacks which are the most common smart contract exploits.</p>		
Recommendation	Add external nonReentrant		
Alleviation	N/A		

Finding ID	MShareReward Pool	Severity	Informational
Type	Testnet Emissions Parameters	Status	Unresolved
Location	Entire Smart Contract		
Description	They launched their smart contract with the testnet emissions parameters still within their code. We suggest getting rid of all of testnet emission parameters and redeploying with a clean slate		
Recommendation	Redeploying with a Clean Slate		
Alleviation	N/A		

Finding ID	MShare Reward Pool	Severity	Medium
Type	Unsupported Token Recovery is Unrestricted after pools expire	Status	Unresolved
Location	L: 832 - 839		
Description	After the governance pools have closed, the operator will be able to transfer any remaining tokens out after a period of days to an arbitrary address		
Recommendation	Remove the conditional such that users' pool tokens can never be recovered from the pool.		
Alleviation	N/A		

Finding ID	MShare Reward Pool	Severity	Medium
Type	Reentrancy Risk Using Token with Callbacks	Status	Unresolved
Location	L: 742-762		
Description	If a token has callbacks (such as <code>anonReceived</code> function in the standard ERC721), then a malicious actor may be able to drain the contract of tokens either via the <code>withdraw</code> or <code>deposit</code> function.		
Recommendation	Follow the checks-effects-interactions pattern. Alternatively, add a reentrancy guard		
Alleviation	N/A		

Finding ID	Treasury	Severity	Medium Risk
Type	Initialize Can be Called by Anyone	Status	Unresolved
Location	L: 1151-1158		
Description	Anyone can initialize the contract and become the operator if the deployer does not initialize in the same transaction.		
Recommendation	If the Treasury need to be changed make sure that the initializer is protected		
Alleviation	N/A		

Finding ID	MShare Reward Pool	Severity	Low
Type	Team Can Add New Team Pool	Status	Unresolved
Location	L: 694-704		
Description	<i>A require</i> statement is used to prevent the operator from modifying the team's allocation pool. However, the operator can deploy a new token and pool and effectively bypass this restriction.		
Recommendation	Put a limit on adding a new pool. Otherwise, remove the <i>require</i> statement as redundant.		
Alleviation	N/A		

Finding ID	Treasury	Severity	Informational
Type	No Limits for Discounted Rate	Status	Unresolved
Location	L: 1276 - 1284		
Description	The noted setters have no limits and can therefore change themaxDiscountRateandmaxPremiumRateto any value.		
Recommendation	Add a reasonable limit for these values.		
Alleviation	N/A		

Finding ID	Magik Token	Severity	Informational
Type	Unnecessary Override	Status	Unresolved
Location	1167 - 1174		
Description	This function appears to be exactly the same as the function that it overrides.		
Recommendation	Confirm that these functions are identical and remove the derived implementation.		
Alleviation	N/A		

Finding ID	MShare Reward Pool	Severity	Informational
Type	Division Before Multiplication 1	Status	Unresolved
Location	L: 720-731		
Description	The calculations noted use mixed orders of multiplication and division. This may cause rounding errors, resulting in miscalculations.		
Recommendation	Change the calculations to first multiply, then divide. (Make sure there is no way of overflowing)		
Alleviation	N/A		

Finding ID	Boardroom	Severity	Informational
Type	No Lower Limit For Lockup Epochs	Status	Unresolved
Location	L: 770-774		
Description	It is possible for the operator to set the withdrawLockupEpochs and rewardLockupEpochs to 0, withdraw their rewards, then change it back		
Recommendation	Add a lower bound to prevent this. A timelock can also resolve this issue.		
Alleviation	N/A		

APPENDIX A: ISSUE SEVERITY CLASSIFICATION

The Auditor(s) assign one of the following Severities to every finding as per common practice.

Critical. Such issues may result in significant loss of funds, complete contract logic breakdown, or the ability of project owners to withdraw liquidity in an unreasonable way. Code snippets proving the project owner's malicious intent are flagged as critical as well. Critical issues require immediate attention, and investing in projects with critical issues is extremely risky. Examples include unguarded mint functions or their executions, provably illicit pool drainage logic, or potential flash-loan vulnerabilities.

Major. Although not proving malicious intent by themselves, major issues may still be exploited by project owners or users for a significant loss of funds or very irregular contract behavior. Examples include centralized ownership without Timelocks and multi-signatures, potential reentrancy vulnerabilities, and concentrated holdings of tokens.

Medium. Such issues do not pose an immediate and severe risk but may pose a risk of partial loss of funds or irregular contract behavior. Examples include susceptibility to obviously unintended investment strategies, high-impact integer overflows, or high-impact standardization faults such as library usage,

Minor. These issues pose a low risk to contract logic or investor funds but may be convenient to consider. Examples include integer overflows in non-essential places, nonversioned libraries, missing or faulty licensing, misleading function names, or low-impact standardization mistakes.

Informational. These issues do not pose any risk to contract logic and investor funds, Examples include tokenomics clarifications, gas optimizations, redundant code, misleading comments, style, and convention.

Confirmational. In specific situations, we issue these findings, which confirm some of the universally-concerning facts that many investors seek. Examples include contract renounces and confirmation of a contract being fork of another protocol. Note: These points are not actual issues. Obviously, only a small subset of tests ran in an audit suite receives its Confirmational Finding.

APPENDIX B: DISCLAIMER

This audit is for informational purposes only and does not provide any financial or investment advice. This report does not substitute, in any way, due diligence and your own research. This report represents result extensive process intending to help our customers improve quality of their code and readers to assess quality of customers' code, but should not be used in any way to make decisions around involvement in any particular project.

Audit has been done in accordance to methodology as outlined in AboutTruth Security and Audit Procedure sections Unless explicitly and specifically stated, only code quality has been reviewed, focusing on security flaws which could cause loss of funds or logical breakdowns within the contracts. Unless explicitly stated, tokenomics have not been reviewed (although in cases of forks of one project, Auditor may point out cases of significant deviations from common settings). Website UI has not been reviewed, as it is impossible for any auditing body to assure security of domains which are under absolute control of owners - always check you are signing correct contracts.

The report does not signify an approval, "endorsement," or „disapproval of the Project. The audit does not indicate in any way your likelihood of making, or not losing, money in the project, as we have no control over issues such as general viability of financial primitives presented, their tokenomics, and actions of project owners including, but not limited to, selling their positions or abandoning the project.

The audit has been based on status dated in section Version Details, on artifacts detailed in Objects of Review. Specifically, we have no control nor knowledge of changes made after the date, or on different artifacts. In case the Objects of Review are not live contracts, but private code or GitHub repositories, we expect these artifacts to be full, unaltered, unabridged, and not misleading.

The audit has been elaborated by paid professional(s) as mentioned in section Audit Procedure. Please note that all statements made in this report are Auditor(s)' and do not reflect stance of © Truth Security Audits itself.

This report is published by © Audits and is under © Truth Security Audits sole ownership. It may not be transmitted, disclosed, modified, referred to, or relied upon by any person for any purposes without © Audits prior written consent.
